### Legend:

---

|       |                                                     |
|-------|-----------------------------------------------------|
| Limit | 99% Confidence Interval (Laboratory Control Limits) |
| DUP   | Duplicate                                           |
| RPD   | Relative Percent Difference                         |
| N/A   | Not Available                                       |
| LCS   | Laboratory Control Sample                           |
| SRM   | Standard Reference Material                         |
| MS    | Matrix Spike                                        |
| MSD   | Matrix Spike Duplicate                              |
| ADE   | Average Desorption Efficiency                       |
| MB    | Method Blank                                        |
| IRM   | Internal Reference Material                         |
| CRM   | Certified Reference Material                        |
| CCV   | Continuing Calibration Verification                 |
| CVS   | Calibration Verification Standard                   |
| LCSD  | Laboratory Control Sample Duplicate                 |

### Sample Parameter Qualifier Definitions:

---

| Qualifier | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| G         | QC result did not meet ALS DQO. Refer to narrative comments for further information.                                                                                                                                 |
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                                                                                          |
| LCS-L     | Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RM-L      | Reference Material recovery was below ALS DQO. Lab Control Sample and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                                                                                          |

## Reference Information

### Methods Listed (if applicable):

| ALS Test Code    | Matrix | Test Description        | Preparation Method Reference(Based On) | Analytical Method Reference(Based On) |
|------------------|--------|-------------------------|----------------------------------------|---------------------------------------|
| HG-CCME-CVAFS-VA | Soil   | CVAFS Hg in Soil (CCME) |                                        | CCME                                  |

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 7000 series).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

| PH-1:2-VA | Soil | CSR pH by 1:2 Water Leach | BC WLAP METHOD: PH, ELECTROMETRIC, SOIL |
|-----------|------|---------------------------|-----------------------------------------|

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (10 mesh /2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

|--------------|------|------------------------------|--------------------------|
| TL-CSR-MS-VA | Soil | ICPMS TI in Soil by CSR SALM | BCMELP CSR SALM Method 8 |
|--------------|------|------------------------------|--------------------------|

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by either hotplate or block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies.

*The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:*

| Laboratory Definition Code | Laboratory Location                          | Laboratory Definition Code | Laboratory Location |
|----------------------------|----------------------------------------------|----------------------------|---------------------|
| VA                         | ALS LABORATORY GROUP - VANCOUVER, BC, CANADA |                            |                     |

## Reference Information

### GLOSSARY OF REPORT TERMS

*Surr* - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency. The Laboratory control limits are determined under column heading D.L.

mg/kg (units) - unit of concentration based on mass, parts per million.

mg/L (units) - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

*Test results reported relate only to the samples as received by the laboratory.*

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

UNLESS OTHERWISE STATED, SAMPLES ARE NOT CORRECTED FOR CLIENT FIELD BLANKS.

*Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.*

*ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.*

**Legend:**

---

|       |                                                     |
|-------|-----------------------------------------------------|
| Limit | 99% Confidence Interval (Laboratory Control Limits) |
| DUP   | Duplicate                                           |
| RPD   | Relative Percent Difference                         |
| N/A   | Not Available                                       |
| LCS   | Laboratory Control Sample                           |
| SRM   | Standard Reference Material                         |
| MS    | Matrix Spike                                        |
| MSD   | Matrix Spike Duplicate                              |
| ADE   | Average Desorption Efficiency                       |
| MB    | Method Blank                                        |
| IRM   | Internal Reference Material                         |
| CRM   | Certified Reference Material                        |
| CCV   | Continuing Calibration Verification                 |
| CVS   | Calibration Verification Standard                   |
| LCSD  | Laboratory Control Sample Duplicate                 |

**Sample Parameter Qualifier Definitions:**

---

| Qualifier | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| DUP-H     | Duplicate results outside ALS DQO, due to sample heterogeneity.                                                                                      |
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                          |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                          |

**AG-DRY-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**AG-WET-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-DRY-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-WET-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-DRY-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MET-WET-MS-VA** Tissue Metals in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**MOISTURE-TISS-VA** Tissue % Moisture in Tissues ASTM METHOD D2974-00

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

| This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3600, 8081 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane Soxhlet extraction of a subsample of the homogenized tissue which has been dried with anhydrous sodium sulphate. The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS) and/or capillary column gas chromatography with electron capture detection (GC/ECD).                                   |        |                                  |                                       |

The extract then undergoes a reverse phase C18 clean-up to remove fats and oils. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).                                                                                                                              |        |                                  |                                       |

| This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic absorption spectrophotometry (EPA Method 7000 series).                                                                                                               |        |                                  |                                       |

\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location | Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|----------------------------|---------------------|
|----------------------------|---------------------|----------------------------|---------------------|

## Reference Information

### GLOSSARY OF REPORT TERMS

*Surr* - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in enviromental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency.

mg/kg (units) - unit of concentration based on mass, parts per million

mg/L (units) - unit of concentration based on volume, parts per million

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

### Sample Parameter Qualifier Definitions:

---

| Qualifier | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                                                                                          |
| MB-LOR    | Method Blank exceeds ALS DQO. LORs adjusted for samples with positive hits below 5 times blank level. Please contact ALS if re-analysis is required.                                                                 |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.                                                                 |
| RM-L      | Reference Material recovery was below ALS DQO. Lab Control Sample and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                                                                                          |

|---------------|--------|------------------|---------------------------------------|

**HG-CCME-CVAFS-VA** Soil CVAFS Hg in Soil (CCME) CCME

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 7000 series).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

**MET-CSR-FULL-ICP-VA** Soil Metals in Soil by ICPOES (CSR SALM) BCMELP CSR SALM METHOD 8

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

**MOISTURE-VA** Soil Moisture content ASTM METHOD D2974-00

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

**OCP1-SOX-ECD-VA** Soil OCP-1 in Soil by Soxhlet GCECD EPA METHODS 3540, 3545, 3610, 3630, 3660

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3545, 3610, 3630, 3660 & 8081, published by the United States Environmental Protection Agency (EPA). The procedure uses an automated system (Accelerated Solvent Extractor - ASE) at high temperature and pressure or a Soxhlet system to extract a subsample of the sediment/soil with dichloromethane. The extract is then solvent exchanged to hexane followed by one or more of the following clean-up procedures (if required): alumina clean-up, silica gel clean-up and/or sulphur clean-up. The final extract is analysed by dual capillary column gas chromatography with electron capture detection (GC/ECD).

**PAH-SURR-MS-VA** Soil PAH Surrogates for Soils EPA METHODS 3570, 3545A & 8270

**PAH-TUMB-H/A-MS-VA** Soil PAH by Tumbler HEX/ACE with GCMS EPA METHODS 3570 & 8270.

Polycyclic Aromatic Hydrocarbons in Sediment/Soil

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3570 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure uses a mechanical shaking technique to extract a subsample of the sediment/soil with a 1:1 mixture of hexane and acetone. The extract is then solvent exchanged to toluene. The final extract is analysed by capillary column gas chromatography with mass spectrometric detection (GC/MS). Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.

**PCB-SOX-ECD-VA** Soil PCBs in Soil by Soxhlet ECD EPA METHODS 3540, 3620, 3630, 3665, 8082

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3540, 3620, 3630, 3665 & 8082, published by the United States Environmental Protection Agency (EPA). The procedure involves a dichloromethane soxhlet extraction of a subsample of the sediment/soil which has been dried with anhydrous sodium sulphate. The extract is then solvent exchanged to hexane followed by one or more of the following clean-up procedures (if required): florisil clean-up, silica gel clean-up and/or sulphuric acid clean-up. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).

**PH-1:2-VA** Soil CSR pH by 1:2 Water Leach BC WLAP METHOD: PH, ELECTROMETRIC, SOIL

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and

## Reference Information

|---------------|--------|------------------|---------------------------------------|

sieved (10 mesh /2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

|                     |      |                              |                          |
|---------------------|------|------------------------------|--------------------------|
| <b>TL-CSR-MS-VA</b> | Soil | ICPMS TI in Soil by CSR SALM | BCMELP CSR SALM Method 8 |
|---------------------|------|------------------------------|--------------------------|

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by either hotplate or block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location                          | Laboratory Definition Code | Laboratory Location |
|----------------------------|----------------------------------------------|----------------------------|---------------------|
| VA                         | ALS LABORATORY GROUP - VANCOUVER, BC, CANADA |                            |                     |

### GLOSSARY OF REPORT TERMS

*Surr* - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency.

mg/kg (units) - unit of concentration based on mass, parts per million

mg/L (units) - unit of concentration based on volume, parts per million

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

**Sample Parameter Qualifier Definitions:**

---

| Qualifier | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| DUP-H     | Duplicate results outside ALS DQO, due to sample heterogeneity.                                                                                      |
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                          |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                          |

|                                                                              |               |                                             |                    |                                                            |  |

**AG-DRY-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**AG-WET-MS-VA** Tissue Silver in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-DRY-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**B-WET-MS-VA** Tissue Total Boron in Tissue by ICPMS PUGET SOUND PROTOCOLS, EPA 6020A

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

**HG-CCME-CVAFS-VA** Soil CVAFS Hg in Soil (CCME) CCME

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of Environment, Lands and Parks, 26 June 2001, and procedures adapted from "Test Methods for Evaluating Solid Waste", SW-846 Method 3050B United States Environmental Protection Agency (EPA). The sample is manually homogenized, dried at 60 degrees Celsius, sieved through a 2 mm (10 mesh) sieve, and a representative subsample of the dry material is weighed. The sample is then digested at 90 degrees Celsius for 2 hours by block digester using a 1:1 ratio of concentrated nitric and hydrochloric acids. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 7000 series).

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

**HG-DRY-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**HG-WET-CVAFS-VA** Tissue Mercury in Tissue by CVAFS PUGET SOUND PROTOCOLS, EPA 245.7

This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. Tissue samples are homogenized either mechanically or manually prior to digestion. The hotplate or block digestion involves the use of nitric acid followed by repeated additions of hydrogen peroxide. Instrumental analysis is by atomic fluorescence spectrophotometry (EPA Method 245.7).

**MET-CSR-FULL-ICP-VA** Soil Metals in Soil by ICPOES (CSR SALM) BCMELP CSR SALM METHOD 8

This analysis is carried out using procedures from CSR Analytical Method 8 "Strong Acid Leachable Metals (SALM) in Soil", BC Ministry of

| <b>PH-1:2-VA</b> | Soil | CSR pH by 1:2 Water Leach | BC WLAP METHOD: PH, ELECTROMETRIC, SOIL |
|------------------|------|---------------------------|-----------------------------------------|

This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe.

**\*\* Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies. The last two letters of the above ALS Test Code column indicate the laboratory that performed analytical analysis for that test. Refer to the list below:**

| Laboratory Definition Code | Laboratory Location                          | Laboratory Definition Code | Laboratory Location |
|----------------------------|----------------------------------------------|----------------------------|---------------------|
| VA                         | ALS LABORATORY GROUP - VANCOUVER, BC, CANADA |                            |                     |

### GLOSSARY OF REPORT TERMS

**Surr** - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency.

mg/kg (units) - unit of concentration based on mass, parts per million

mg/L (units) - unit of concentration based on volume, parts per million

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

| IRM   | Internal Reference Material                         |
| CRM   | Certified Reference Material                        |
| CCV   | Continuing Calibration Verification                 |
| CVS   | Calibration Verification Standard                   |
| LCSD  | Laboratory Control Sample Duplicate                 |

### Sample Parameter Qualifier Definitions:

---

| Qualifier | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| J         | Duplicate results and limits are expressed in terms of absolute difference.                                                                                                                                          |
| RM-H      | Reference Material recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.                                                                 |
| RM-L      | Reference Material recovery was below ALS DQO. Lab Control Sample and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified. |
| RPD-NA    | Relative Percent Difference Not Available due to result(s) being less than detection limit.                                                                                                                          |

## ALS Laboratory Group Quality Control Report

Workorder: L780819

Report Date: 14-JUL-09

Page 19 of 19

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates that do not originate from this Work Order.

## **1 RESUMEN**

Los datos de calidad ambiental medidos y pronosticados (es decir suelo, sedimento, agua superficial, tejido de peces, productos agrícolas y aire) se evaluaron mediante su comparación con valores normativos relevantes y aplicables y con la calidad de la línea base. Los químicos de interés potencial (CIP) se identificaron como aquellas sustancias que excedieron el valor normativo más bajo y además mostraron un incremento del 10% o más sobre la concentración media de la línea base en cualquier lugar. Se consideró la comparación con los valores indicados en las normas con el fin de representar una evaluación conservadora del potencial para las concentraciones pronosticadas y así extraer los efectos adversos. Se consideró que la comparación con las concentraciones del 10% por encima de las de la línea base representaban una evaluación conservadora en cuanto a la probabilidad de ocurrencia de un impacto medible relacionado con el Proyecto en relación a la calidad ambiental. Debido a la variabilidad temporal, la variabilidad en los métodos de muestreo y los análisis de laboratorio, y la incertidumbre inherente en los modelos para pronosticar la calidad del agua, aire y suelo, se consideró improbable que cualquier incremento pronosticado por encima del 10% de la línea base reflejase un cambio real relacionado con el Proyecto en la calidad ambiental. En este apéndice se resume la forma cómo se generaron los datos de exposición (es decir medidos o pronosticados) y la forma cómo se evaluaron (es decir estadísticas utilizadas con el fin de generar concentraciones de exposición) para los CIP, según se identificaron anteriormente, en su utilización en la evaluación del riesgo para la salud humana y la ecología (ERSHE). El apéndice se estructura tal como se indica a continuación: en la Sección 2.0 se resume las concentraciones de exposición generadas para el caso de la línea base, en la Sección 3.0 se proporciona información sobre los factores de bioacumulación que se utilizaron para generar los datos del caso de impacto y en la Sección 4.0 se resume las concentraciones de exposición generadas por el caso de impacto.

## **2 CONCENTRACIONES DE LA LÍNEA BASE**

### **2.1 SUELO, SEDIMENTO, AGUA Y PECES**

Las muestras ambientales se recolectaron en varias matrices (suelo, agua, plantas, etc.) en el área de estudio entre octubre de 2008 y abril de 2009. En el Anexo XIX, Apéndice A se describe los métodos de trabajo de campo y en el Anexo XIX, Apéndice B se incluye los informes de laboratorio. Los datos ambientales específicos para el área se utilizaron con el fin de representar las condiciones de la línea base en el área de estudio y también como una base para pronosticar las concentraciones de impacto. La frecuencia de detección se calculó para cada parámetro y los valores no detectados se reemplazaron por el límite de detección de laboratorio previo al cálculo de las concentraciones de exposición de la línea base.

Las concentraciones de exposición del límite superior (es decir escenario razonable del peor caso) en cada matriz ambiental se estimaron como el percentil 90 de todos los datos. Con el fin de disponer de un contexto para los estimados de exposición del límite superior, los cálculos se efectuaron también tomando como base las tendencias centrales estimadas de concentraciones de CIP en cada matriz. La diferencia entre los estimados de límite superior y de tendencia central (promedio o típicos) proporciona una indicación de la variabilidad de los datos de exposición. Las concentraciones de la tendencia central se estimaron como la concentración media en casos donde más de la mitad de los resultados se detectaron por encima de los límites de detección del laboratorio (es decir frecuencia de detección > 50%). En las Tablas 1 a 7 se resume las estadísticas y las concentraciones de exposición para cada matriz.

### **2.2 AIRE**

Con el fin de determinar con exactitud las concentraciones a nivel del suelo en las comunidades del área de estudio se requiere determinar las emisiones de las actividades que ocurren dentro de las comunidades. Para ello se utilizó un método consistente en calcular las emisiones de las actividades locales e incluirlas en el modelado, sin embargo la información acerca de las actividades de las comunidades como la cantidad de vehículos y la distancia desde la comunidad es con frecuencia difícil de estimar. En consecuencia los datos de monitoreo de la calidad del aire disponibles de Río Caimito ( $MP_{10}$  y metales) se utilizaron para estimar las concentraciones de fondo de la comunidad; también se dispone de los datos de monitoreo del campamento Colina, sin embargo las actividades previas al Proyecto tales como la construcción del camino influyeron en gran medida en las lecturas y no se les consideró representativas de las condiciones de fondo (ver evaluación de impacto en la calidad del aire, Capítulo 9, Sección 9.1.8).

Las concentraciones de aire de fondo (es decir de la línea base) se estimaron en ubicaciones adicionales en el área de estudio mediante la adaptación de los datos del río Caimito según la población para cada una de las comunidades. Las concentraciones utilizadas en la ERSHE de la línea base son las siguientes:

- 1) **Receptores Costeros:** concentraciones de fondo en el río Caimito.
- 2) **Receptores Agrícolas:** concentraciones de fondo para las tres comunidades agrícolas Los Molejones, San Benito y Coclesito (concentración promedio utilizada para la tendencia central, concentración máxima utilizada para el modelo de límite superior).
- 3) **Receptores Indígenas:** concentraciones de fondo para las dos comunidades indígenas Nueva Lucha y Nuevo Sinaí (concentración promedio utilizada para la tendencia central, concentración máxima utilizada para el modelo de límite superior).

## 2.3 HOJAS, FRUTAS, PRODUCTOS AGRÍCOLAS E INVERTEBRADOS

Para algunas matrices (hojas, frutas, arroz e invertebrados), los datos disponibles se consideraron insuficientes con el fin de proporcionar estimados confiables de las concentraciones en el lugar debido al tamaño pequeño de la muestra y/o a la muy baja frecuencia de detección con límites de detección elevados en algunos casos. En consecuencia las concentraciones de la línea base para estas matrices se estimaron con los datos del suelo recolectados en el área de estudio y los factores de bioacumulación (FBA). El FBA corresponde a la proporción de concentración entre planta/fruta/tejido y suelo, por ejemplo las concentraciones de límite superior se estimaron como concentración de suelo de límite superior multiplicada por el FBA para dicho parámetro. Cuando fue posible, los FBA se derivaron utilizando datos específicos del área y los valores obtenidos del material bibliográfico se sustituyeron cuando no se dispuso de información suficiente sobre el área (ver Sección 2.0). En las Tablas 8 y 9 se resume las concentraciones de la línea base utilizadas en la evaluación del riesgo para la salud humana y la ecología (ERSHE) para la tendencia central y el límite superior respectivamente.

## 2.4 GANADO

Las concentraciones en el tejido de vacunos (vacas) y pollos se pronosticaron utilizando un modelo de cadena alimenticia según el cual se estimó para cada animal la ingesta diaria total (mg/kg-día) y se multiplicó por un factor de transferencia de bioacumulación (Baes 1984), la metodología del modelo se describe en mayor detalle

Concentraciones Ambientales para Utilización en Modelos ERSHE

---

en el Anexo XIX, Apéndice G. Las siguientes concentraciones ambientales se utilizaron como parámetros de exposición en los modelos de ganado de la línea base:

- concentraciones de suelo en la línea base;
- las concentraciones de agua de la línea base (se utilizó agua de la comunidad); y
- arroz, invertebrados y hojas de la línea base.

Se debe aquí tener en cuenta el hecho de que los valores de tendencia central se utilizaron con el fin de pronosticar las concentraciones de tendencia central en el ganado mientras que las concentraciones ambientales de límite superior se utilizaron para pronosticar las concentraciones de ganado de límite superior. Las concentraciones en vacuno y pollo utilizadas en los modelos ERSHE se resumen en las Tablas 8 (tendencia central) y 9 (límite superior).

### 3 FACTORES DE BIOACUMULACIÓN

Las concentraciones de línea base e impacto para hojas, frutas, productos agrícolas (arroz y yuca/guineo para seres humanos) e invertebrados se estimaron utilizando el FBA. El FBA corresponde a la proporción de concentración entre planta/fruta/tejido y suelo. Con frecuencia la relación entre el suelo y el tejido se representa mejor por una ecuación, comúnmente como la regresión lineal del tejido y las concentraciones de suelo en forma de logaritmo (ver ítem 1 a continuación).

Cuando fue posible, se utilizaron los datos del área con el fin de generar FBA específicos del área para cada matriz y sólo se consideraron los datos detectados que ocurrieron en forma simultánea (es decir datos de suelo y tejido recolectados en el mismo lugar al mismo tiempo) para derivar los FBA. Se utilizaron las siguientes reglas para la selección de los FBA:

- 1) cuando se dispuso de más de cinco pares de datos detectados, se efectuó una regresión lineal utilizando las concentraciones de tejido y suelo en forma de logaritmo. Si los resultados de la regresión se consideraron significativos (es decir  $p\text{-valor} < 0.05$ ) y cumplieron con los supuestos de la regresión lineal, entonces la ecuación de regresión se retuvo como el FBA para dicho parámetro (por ejemplo  $\log C_{\text{tejido}} = \log C_{\text{suelo}}(x) + b$ ). Si los resultados no se consideraron como significativos, entonces se mantuvo como el FBA el cociente promedio o medio de la concentración tejido a suelo (ver punto (2) más adelante)
- 2) cuando se dispuso de por lo menos un par de datos detectados, el cociente de concentración de tejido (hoja, fruta, arroz o invertebrado) y concentración de suelo se calculó para cada par de datos correspondiente. Se calcularon los cocientes medio y mediano y se seleccionó el valor más alto (medio o mediano) como FBA para el parámetro
- 3) cuando no se dispuso para un parámetro-matriz de ningún dato detectado, se adoptaron los valores de FBA suministrados por material bibliográfico. Los FBA del material bibliográfico para hojas (cocientes de absorción suelo a planta,  $B_v$ ) se obtuvieron a partir de la base de datos de los Sistema de Información de la Evaluación del Riesgo (RAIS) (RAIS 2010). En el caso de las frutas y productos agrícolas se seleccionó como FBA los cocientes de absorción suelo a planta para las partes no vegetales de las plantas según Baes. (1984), y los factores de bioacumulación se extrajeron de los documentos EcoSSL de US EPA (US EPA 2007).

En las Tablas 10 a 12 se resume los FBA seleccionados para la ERSHE.

## **4 CONCENTRACIONES DE IMPACTO**

Las concentraciones de impacto en el área se pronosticaron según los datos de deposición de aire y modelamiento de la calidad del agua (Capítulo 9, Secciones 9.1.8 y 9.1.7, respectivamente). Los métodos utilizados con el fin de determinar las concentraciones de la exposición al impacto para cada matriz se describen a continuación y las concentraciones de exposición utilizadas en los modelos de impacto de la ERSHE se resumen en las Tablas 13 a 16.

### **4.1 AGUA**

Las concentraciones de impacto en el agua dulce se pronosticaron en quince ubicaciones del área de estudio y las metodologías y pronósticos de calidad del agua se describen en forma más detallada en la Sección 9.1.7. Se estimó las concentraciones promedio en cada ubicación para determinados momentos desde los primeros años de operación de la mina (años 0 a 4) a post-cierre (>54 años). En la ERSHE la concentración promedio máxima en el tiempo se seleccionó en forma conservadora a fin de representar las condiciones de impacto en cada ubicación.

Las concentraciones de exposición utilizadas en las evaluaciones de riesgo corresponden a las siguientes:

- 1) evaluación del riesgo ecológico: se seleccionó la concentración media para todas las ubicaciones como la tendencia central y se seleccionó la concentración del percentil 90 como la concentración de exposición de límite superior
- 2) evaluación del riesgo a la salud humana: se pronosticó las concentraciones de exposición por separado para dos grupos de receptores, comunidades indígenas y comunidades agrícolas. En cada grupo receptor se utilizó las concentraciones pronosticadas en el agua superficial en ubicaciones cercanas a las comunidades receptoras con el fin de estimar la concentración de exposición (un total de cuatro ubicaciones para cada receptor). Se utilizó las concentraciones promedio y máximas en estas ubicaciones con el fin de representar la tendencia central y las concentraciones de límite superior, respectivamente y se utilizó la concentración máxima en lugar del percentil 90 para el estimado del límite superior debido al pequeño tamaño de la muestra (sólo cuatro concentraciones pronosticadas en cada ubicación). Los receptores costeros en la comunidad de Río Caimito se evaluaron en la ERSHE, sin embargo se asumió que estos receptores entrarían en contacto con el agua de mar en lugar del agua dulce durante las actividades recreacionales (es decir nado), por lo que para este grupo de receptores no se estimaron las concentraciones de agua dulce.

En la ERSHE se supuso que las actividades mineras no impactaron en forma significativa el agua de mar y el suministro de agua de la comunidad (Capítulo 9, Sección 9.1.7) y en consecuencia, para estas matrices se conservaron las concentraciones de la línea base.

## **4.2 PECES**

Las concentraciones de agua pronosticadas se utilizaron como base para estimar concentraciones de impacto en los peces de agua dulce. En cada una de las quince ubicaciones de agua superficial modeladas, se calculó un cociente de incremento dividiendo la concentración de impacto pronosticada (concentración máxima en el tiempo) entre la concentración de la línea base en esta ubicación. Los cocientes de incremento entonces se utilizaron para calcular las concentraciones de peces pronosticadas en cada lugar, utilizando la siguiente ecuación:

$$\text{concentraciones de impacto en los peces} = \text{concentración en los peces de línea base} \times \text{cociente de incremento}$$

Las concentraciones de peces de la línea base en la tendencia central se utilizaron para pronosticar las concentraciones de impacto en la misma tendencia mientras que las concentraciones de la línea base del límite superior se utilizaron para pronosticar las concentraciones de impacto del límite superior para los peces.

Las concentraciones de exposición para uso en las evaluaciones de riesgo se calcularon de la misma manera que para el agua (es decir media y percentil 90 para los receptores ecológicos y media y máxima de las concentraciones específicas de la comunidad para los seres humanos) y se supuso que los receptores costeros consumen peces del ambiente marino. Ya que no se pronosticó incrementos en las concentraciones del agua de mar, se supuso que los peces de mar tienen las mismas concentraciones que en el escenario de la línea base.

## **4.3 SEDIMENTO**

No se supuso que las concentraciones en el sedimento cambiasen en forma significativa entre los escenarios de la línea base y de impacto (Capítulo 9, Sección 9.1.7) y por lo tanto las concentraciones de la línea base se utilizaron para el sedimento en los modelos de impacto.

#### **4.4 AIRE**

El Equipo de Aire estimó las concentraciones de CIP en el aire para el escenario de impacto mediante el uso de modelos predictivos. Las concentraciones de impacto se basaron en las concentraciones de fondo en el aire (Sección 2.2 de este Apéndice) más la contribución adicional pronosticada de las actividades mineras. Las concentraciones de impacto en el aire y las tasas de deposición asociadas para los metales y PAH se pronosticaron en trece lugares del área de estudio, incluyendo Río Caimito y varias comunidades agrícolas e indígenas. Las tasas de deposición se utilizaron para pronosticar las concentraciones de impacto en el suelo y la vegetación en cada ubicación (Secciones 3.5 y 3.6). En la Sección 9.1.8 se proporciona información más detallada con respecto a la metodología de modelado.

Las concentraciones de exposición utilizadas en el modelo de impacto de la ERSHE corresponden a las siguientes:

- receptores costeros: concentración pronosticada en el Río Caimito utilizada para la concentración de exposición, debido a que se dispuso de sólo una ubicación, se utilizó el mismo valor para los modelos de tendencia central y límite superior
- receptores agrícolas: las concentraciones pronosticadas en San Benito, Los Molejones y Coclesito se utilizaron para estimar la exposición, se utilizó una concentración promedio para el estimado de tendencia central y la concentración máxima para el estimado del límite superior
- receptores indígenas: las concentraciones pronosticadas en Nueva Lucha y Nuevo Sinaí se utilizaron para estimar la exposición, se utilizó una concentración promedio para el estimado de tendencia central y la concentración máxima para el estimado del límite superior
- receptores del límite del área ocupada por el Proyecto: la concentración pronosticada en los alrededores del cerco perimetral se utilizó con el fin de evaluar los riesgos para los receptores recreacionales en esta área, debido a que se dispuso de sólo una ubicación, el mismo valor se utilizó para los modelos de tendencia central y límite superior

#### **4.5 SUELO**

Las concentraciones de impacto de los CIP en el suelo se pronosticaron en varias ubicaciones del área de estudio para su uso en la ERSHE, la concentración de impacto pronosticada en el suelo se estimó como:

Concentración de impacto = concentración de la línea base + concentración incremental debido a la deposición atmosférica.

Concentraciones Ambientales para Utilización en Modelos ERSHE

Las tasas de deposición se pronosticaron en trece ubicaciones del área de estudio (Sección 3.4) y se utilizaron para calcular las concentraciones incrementales en el suelo debido a la deposición atmosférica. Para calcular las concentraciones incrementales en el suelo se utilizó la siguiente ecuación, extraída de la US EPA (2005, Capítulo 5):

$$Cs = \frac{100 \times (D_{yd} + D_{yw}) \times tD}{Zs \times BD}$$

donde:

- Cs = concentración incremental en el suelo debido a la deposición relacionada con la mina
- D<sub>yd</sub> = tasa de deposición seca anual de contaminantes (g/m<sup>2</sup>-año), específica del Proyecto
- D<sub>yw</sub> = tasa de deposición húmeda anual de contaminantes (g/m<sup>2</sup>-año), específica del Proyecto
- tD = período de tiempo durante el cual ocurre la deposición (años), se supone 30 años (específico del Proyecto)
- Zs = profundidad de mezcla de suelos (en cm), 2 cm (suelo sin cultivar, US EPA 2005)
- BD = densidad aparente del suelo (g/cm<sup>3</sup>), 1.5 g/cm<sup>3</sup> (US EPA 2005)

Las tasas de deposición se extrajeron de los resultados del modelado del aire (Sección 3.4). y se supuso que la deposición en el suelo ocurrirá durante toda la fase de operaciones de la mina (es decir tD = 30 años).

Las concentraciones de impacto se calcularon tres veces en cada ubicación, la primera utilizando la concentración máxima de la línea base (resultados utilizados para el análisis de CIP), la segunda utilizando las concentraciones de la línea base de tendencia central (para el cálculo de la concentración de impacto de la tendencia central) y la tercera utilizando las concentraciones de la línea base del límite superior (para el cálculo de las concentraciones de suelo de límite superior).

Las concentraciones de exposición utilizadas en los modelos ERSHE corresponden a las siguientes:

- 1) receptores ecológicos: la concentración media de impacto tomando como base la tendencia central, utilizada como tendencia central y percentil 90 de la concentración de impacto basada en el límite superior, utilizada como la concentración de exposición de límite superior.

- 2) receptores humanos: los riesgos se evaluaron por separado para las comunidades costeras, agrícolas e indígenas. Las concentraciones de impacto en el suelo en el Río Caimito se utilizaron con el fin de evaluar a los receptores costeros, las concentraciones en San Benito, Los Molejones y Coclesito con el fin de evaluar a los receptores agrícolas (promedio para la tendencia central y máxima para las concentraciones de límite superior) y las concentraciones en Nueva Lucha y Nuevo Sinaí con el fin de evaluar a los receptores indígenas (promedio para la tendencia central y máxima para las concentraciones de límite superior). Adicionalmente las concentraciones de impacto pronosticadas en los alrededores del cerco perimetral se utilizaron con el fin de evaluar los riesgos para los receptores recreacionales en esta área.

#### 4.6 HOJAS, FRUTA Y PRODUCTOS AGRÍCOLAS (ARROZ, YUCA/GUINEO)

Las concentraciones en hojas, frutas (en relación a la evaluación del riesgo para la ecología) y en los productos agrícolas (en relación a la evaluación del riesgo para la salud humana) se pronosticaron a través de la siguiente ecuación:

concentración de impacto = concentración de impacto en el suelo x BAF + deposición de partículas

El cálculo de las concentraciones de impacto en el suelo se describe en la Sección 3.5 y el procedimiento para seleccionar el FBA se describe en la Sección 2.0. La deposición de partículas se calculó utilizando las tasas de deposición pronosticadas (Sección 3.4) y la ecuación proporcionada en US EPA (2005):

$$Pd = \frac{1000 \times (D_{yd} + (Fw \times D_{wyd})) \times R_p \times (1.0 - \exp(-k_p \times T_p))}{Y_p \times k_p}$$

donde:

- Pd = concentración incremental debido a la deposición del aire (mg/kg peso seco)  
 D<sub>yd</sub> = tasa de deposición de partículas secas (g/m<sup>2</sup>/a), específica del Proyecto  
 Fw = fracción de deposición húmeda de CIP que se adhiere a la superficie de la planta  
 D<sub>wyd</sub> = tasa de deposición húmeda (g/m<sup>2</sup>/a), específica del Proyecto  
 R<sub>p</sub> = fracción de interceptación, representa una porción de la deposición química interceptada por las plantas, 0.39 para bayas/frutas/vegetales (US EPA 2005)  
 Y<sub>p</sub> = producción agrícola (kg peso seco/m<sup>2</sup>), 0.25 (US EPA 2005)  
 T<sub>p</sub> = duración de la exposición de la planta a la deposición por cosecha, 0.16 (US EPA 2005)  
 k<sub>p</sub> = remoción química de la superficie de la planta por efecto de la intemperie (año<sup>-1</sup>), 18 para todas las plantas (US EPA 2005)

Las tasas de deposición se obtuvieron del ejercicio de modelado del aire (Sección 3.2) y las variables restantes corresponden a valores por defecto asignados tomando como base los recomendados por US EPA (2005) para productos agrícolas y hojas comestibles. Las concentraciones de impacto para cada una de las matrices se estimaron para las trece ubicaciones en las que se dispuso de los datos de suelo pronosticados. Las concentraciones de exposición para utilizar en los modelos de la ERSHE se determinaron de la misma manera que para el suelo (es decir promedio y percentil 90 en los receptores ecológicos y concentraciones específicas del área en los grupos de receptores humanos).

#### **4.7 INVERTEBRADOS**

Las concentraciones en invertebrados se pronosticaron utilizando concentraciones de impacto en suelos y FBA y las concentraciones de impacto para estas matrices se estimaron como sigue:

$$\text{concentración de impacto} = \text{concentración de impacto en el suelo} \times \text{FBA}$$

El procedimiento para seleccionar FBA se describe en la Sección 2.0 y las concentraciones de impacto para cada una de las matrices se estimaron para las trece ubicaciones en las que se dispuso de los datos de suelo pronosticados. Las concentraciones de exposición para uso en los modelos de la ERSHE se determinaron de la misma manera que para el suelo (es decir promedio y percentil 90 en los receptores ecológicos y concentraciones específicas del área en los grupos de receptores humanos).

#### **4.8 GANADO (PARA ERSHE)**

Las concentraciones en el tejido de vacunos (vacas) y pollos se estimaron utilizando un modelo de cadena alimenticia (ver Anexo XIX, Apéndice G) utilizando para ello el mismo método que para la evaluación de la línea base. Las siguientes concentraciones ambientales se utilizaron como parámetros de exposición para el ganado en las regiones agrícolas e indígenas.

Receptores agrícolas:

- concentración de impacto en el suelo para receptores agrícolas;
- concentraciones en el suministro de agua de la comunidad (iguales en la línea base, supuestas sin cambio para el impacto); y

---

Concentraciones Ambientales para Utilización en Modelos ERSHE

---

- concentraciones de impacto en el arroz, invertebrados y hojas (concentraciones de impacto pronosticadas para los receptores agrícolas: datos de Los Molejones, Coclesito y San Benito).

## Receptores indígenas:

- concentración de impacto en el suelo para receptores indígenas (es decir en Nueva Lucha y Nuevo Sinaí);
- concentraciones de impacto en el agua superficial para los receptores indígenas; y
- concentraciones de impacto en el arroz, invertebrados y hojas (concentraciones de impacto pronosticadas para los receptores indígenas: datos de Nueva Lucha y Nuevo Sinaí).

Debe aquí tenerse en cuenta que los valores de tendencia central de todas las matrices se utilizaron con el fin de pronosticar las concentraciones de tendencia central en el ganado mientras que las concentraciones de límite superior se utilizaron con el fin de pronosticar las concentraciones de límite superior en el ganado. Se supuso que los receptores costeros (es decir residentes de Río Caimito) obtuvieron sus productos cárnicos de la región agrícola.

<sup>(a)</sup> Los estándares que se muestran pertenecen a las Lineamientos para la Salud Humana del Consejo Canadiense de Ministros del Ambiente (CCME) para terrenos residenciales (TR) y tierras agrícolas (TA)  
Los factores propios del área incluyen: i= ingestión de suelo; c = contacto con el suelo; n = provisional; d = contacto directo; p = provisional.  
<sup>(b)</sup> Cuando no se contó con un estándar de CCME aplicable, se utilizó los Niveles de Análisis de Suelos Residenciales Regionales para Contaminantes Químicos en Sitios del Superfondo (Sept 2008) del Laboratorio Nacional de Oakridge (se ajustó las lineamientos para que reflejen un ILCR de 10-5, un HQ de 0.2).  
<sup>(c)</sup> Tipo de vegetación recogida en la ubicación de la muestra de suelo.

< = Menor a la concentración mínima detectable

|            |                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>500</u> | subrayado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas                        |
| <b>500</b> | <b>en negrita indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales</b>           |
| <u>500</u> | subrayado/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas              |
| <b>500</b> | <b>en negrita/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales</b> |
| <u>500</u> | <i>subrayado/en cursiva indica que las concentraciones son mayores que los estándares de suelos urbanos de Panamá</i>                                            |
| <b>500</b> | <b><i>en negrita/en cursiva indica que las concentraciones son mayores que los estándares de suelos de Panamá, otros</i></b>                                     |
| <i>500</i> | <i>en cursiva indica que el límite de detección del método es mayor que las lineamientos del CCME</i>                                                            |

Nota: Todas las unidades están en miligramos por kilogramo (mg/kg) a menos que se indique de otro modo

Notas:  
<sup>(a)</sup> Los estándares que se muestran pertenecen a las Lineamientos para la Salud Humana del Consejo Canadiense de Ministros del Ambiente (CCME) para terrenos residenciales (TR) y tierras agrícolas (TA)

Los factores propios del área incluyen: i= ingestión de suelo y alimentos; c = contacto con el suelo; n = directriz interina sustituida

\* B[a]P TPE – Equivalentes totales de potencia es la suma de la potencia cancerígena estimada relativa a B[a]P usando los siguientes factores de equivalencia de potencia: benz(a)antraceno = 0.1, benzo(a)pireno = 1; benzo(b)fluoranteno = 0.1; benzo(k)fluoranteno = 0.1; criseno = 0.01; benzo(g,h,i)perileno = 0.01; dibenz(a,h)antraceno = 1; indeno(1,2,3-c,d)pireno = 0.1. Cuando no se detectó un parámetro, se utilizó la mitad del límite de detección.

< = Menor a la concentración mínima detectable

subrayado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas

**en negrita indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales**

subrayado/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas

**en negrita/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales**

*subrayado/en cursiva indica que las concentraciones son mayores que los estándares de suelos urbanos de Panamá*

**en negrita/en cursiva indica que las concentraciones son mayores que los estándares de suelos de Panamá, otros**

*en cursiva indica que el límite de detección del método es mayor que las lineamientos del CCME*

<sup>(a)</sup> Los estándares que se muestran pertenecen a las Lineamientos para la Salud Humana del Consejo Canadiense de Ministros del Ambiente (CCME) para terrenos residenciales (TR) y tierras agrícolas (TA)

Los factores propios del área incluyen: t= consumidor terciario

<sup>(b)</sup> Cuando no se contó con un estándar de CCME aplicable, se utilizó los Niveles de Análisis de Suelos Residenciales Regionales para Contaminantes Químicos en sitios del Superfondo (Sept, 2008) del Laboratorio Nacional de Oakridge (se ajustó las lineamientos para que reflejen un ILCR de 10-5, un HQ de 0.2)

< = Menor a la concentración mínima detectable

|     |                                                                                                                                                           |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 500 | subrayado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas                 |
| 500 | en negrita indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales           |
| 500 | subrayado/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas       |
| 500 | en negrita/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales |
| 500 | subrayado/en cursiva indica que las concentraciones son mayores que los estándares de suelos urbanos de Panamá                                            |
| 500 | en negrita/en cursiva indica que las concentraciones son mayores que los estándares de suelos de Panamá, otros                                            |
| 500 | en cursiva indica que el límite de detección del método es mayor que las lineamientos del CCME                                                            |

Nota: Todas las unidades están en miligramos por kilogramo (mg/kg) a menos que se indique de otro modo

<sup>(a)</sup> Los estándares que se muestran pertenecen a las Lineamientos para la Salud Humana del Consejo Canadiense de Ministros del Ambiente (CCME) para terrenos residenciales (TR) y tierras agrícolas (TA)

Los factores propios del área incluyen: s= consumidor secundario (aves)

<sup>(b)</sup> Cuando no se contó con un estándar de CCME aplicable, se utilizó los Niveles de Análisis de Suelos Residenciales Regionales para Contaminantes Químicos en Sitios del Superfondo (Sept, 2008) del Laboratorio Nacional de Oakridge (se ajustó las lineamientos para que reflejen un ILCR de 10-5, un HQ de 0.2)

< = Menor a la concentración mínima detectable

|            |                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>500</u> | subrayado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas           |
| <b>500</b> | en negrita indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales     |
| <u>500</u> | subrayado/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de las tierras agrícolas |
| <b>500</b> | en negrita/sombreado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME de los terrenos residenciales    |
| <i>500</i> | subrayado/en cursiva indica que las concentraciones son mayores que los estándares de suelos urbanos de Panamá                                      |
| <b>500</b> | en negrita/en cursiva indica que las concentraciones son mayores que los estándares de suelos de Panamá, otros                                      |
| <i>500</i> | en cursiva indica que el límite de detección del método es mayor que las lineamientos del CCME                                                      |

Nota: Todas las unidades están en miligramos por kilogramo (mg/kg) a menos que se indique de otro modo
